

**Hydromulch** is a mix that helps protect newly planted turf from erosion and to aid quick plant installation. Hydromulch will hold moisture, protect from wind, rain, sun, and bugs by binding the grass seed and the mulch mix.

**Hydroseeding** typically consists of applying a mixture of wood fiber, seed, and fertilizer. It temporarily protects exposed soils from erosion by water and wind. Hydroseeds are applied on disturbed soil areas requiring temporary protection until permanent vegetation is established.
